

12. LET Implementation

The Interpreter

The interpreter revolves around the `(value-of exp e)`

```
(define run
  (lambda (string)
    (value-of-program (scan&parse string))))

(define value-of-program
  (lambda (pgm)
    (cases program pgm
      (a-program (exp1)
        (value-of exp1 (init-env))))))
```
